Packaging for load which is parachuted from aircraft - has
outer casing made in form of truncated pyramid, with minor base facing
parachute suspension elements, and transverse stress elements with preset
release level connections

Abstract (Basic): RU 2014248 C

This parachuted load's packing has a cylindrical shock-absorbing enclosure (1) in which a standard container (2) holding bulk material weighing up to 70 kgs. is situated. A load bag with a double bottom is made of Kapron (RTM) panelling or polyethylene film. The main outer casing (4) is connected by breakable cords or bands. The elements in the main packaging serve to absorb shock on landing, and are novel in design.

ADVANTAGE - Greater protection for fragile loads when landing.
